1.1.This Instruction establishes the procedure for systematically assessing, monitoring and improving the quality of subjects, modules and courses within the undergraduate education areas, master's degree specialties and other relevant educational programs implemented at Termez State University.

1.2.The instruction applies to all faculties, departments, educational programs, professors and teachers of the University, as well as structural divisions participating in the process of assessing the quality of science.

1.3.In this Guide, assessing the quality of a subject or course does not mean assessing the individual knowledge of a student, but rather:

- science objectives and learning outcomes;
- teaching and learning methods;

- It is understood as a comprehensive study of the quality of improvement work carried out in science.

1.4.This Instruction was developed based on the legislation of the Republic of Uzbekistan on education, the National Qualifications Framework, state educational standards and requirements, relevant sectoral qualification frameworks, professional standards, the University Charter, "Quality Assurance Policy and Standards at Termez State University" and other relevant internal documents.

1.5.In developing the guidelines, the following requirements of quality assurance standards and guidelines in the European Higher Education Area were adopted as a methodological basis:

ESG standard	Usage in the instructions
ESG 1.1	The dependence of science quality assessment on institutional quality policy
ESG 1.2	Compliance of subject results with the goals and outcomes of the educational program
ESG 1.3	Student-centered teaching, assessment, and feedback
ESG 1.7	Collect, analyze, and use reliable data in decision-making

ESG 1.9	Continuous monitoring and improvement of science and educational programs
---------	---

1.6. The planned learning outcomes in the subject should contribute to the outcomes of the relevant educational program and, depending on the level and nature of the educational program, be linked to the following descriptions in the National Qualifications Framework:

1.7. In disciplines with a vocational focus, the relevant sectoral qualification framework, professional standards, employer requirements, and labor market needs are also taken into account.

1.8. In the absence of a direct link to a professional standard in general education, methodological or fundamental subjects, the contribution of the subject to the results of the educational program, general academic competencies and the corresponding qualification level is assessed.

1.9. When assessing subjects in international or joint educational programs, the requirements of the partner higher education institution, international accreditation criteria, and relevant international standards may be taken into account, in addition to these Guidelines.

1.10. Evaluating the quality of a subject is not a means of evaluating a professor based on a single indicator, a student questionnaire, or a percentage of mastery. The final conclusion is formed based on a comparison of several independent facts.

Basic concepts

1.11. The following key concepts are used in this Guide:

subject or course- an educational component within an educational program with a specific amount of credits, objectives, content, learning outcomes, and assessment requirements;

science quality- the degree to which the purpose, content, teaching methods, assessment tools and resources of the subject ensure the achievement of the learning outcomes set by students;

learning outcome- a measurable outcome that the student should know, understand, and be able to do at the end of the subject;

science and program outcomes correspondence matrix- a document indicating the contribution of the results of the science to the results of the educational program;

evidence- a verifiable document, information in an information system, analysis, survey results, or other reliable source confirming the assessment conclusion;

inconsistency- failure to meet the established requirement in the subject or failure to achieve the result;

improvement measure- a specific task aimed at eliminating the identified problem or improving the quality of science;

re-monitoring- re-examine the effectiveness of the measure taken after a specified period.

2. PURPOSE AND OBJECTIVES OF THE GUIDE

2.1. The main goal of assessing the quality of a subject is to determine the adequacy and effectiveness of subject content, teaching methods, assessment tools, and educational resources in helping students achieve the intended learning outcomes.

2.2. The main tasks of assessing the quality of science are:

1. Determining the compliance of the goals and outcomes of the subject with the goals and outcomes of the educational program;
2. Checking the relevance of science outcomes to the National Qualifications Framework, state educational standards, qualification requirements, and relevant professional standards;
3. Assess the relevance, coherence, and logical sequence of scientific topics;
4. Studying teaching methods and the effectiveness of independent learning;
5. Determine the ability of assessment tasks to measure science outcomes;
6. Assessing the transparency, objectivity, and reliability of the assessment;
7. Analysis of the causes of student embezzlement and academic debt;
8. Studying students' opinions and educational experiences;
9. Assess the adequacy of educational resources and their utilization;
10. Identify strengths and best practices in science;
11. Identify improvement measures for identified deficiencies;
12. Re-monitoring the effectiveness of the measures taken.

3. PRINCIPLES OF SCIENCE QUALITY ASSESSMENT

3.1.The assessment of the quality of science is based on the following principles:

- respect for the professional honor and dignity of a professor;
- prevention of conflicts of interest;

3.2.Assessment serves not only to identify shortcomings, but also to identify strengths, best practices, and opportunities for development.

3.3.The results of the quality assessment of science are used primarily to improve the teaching and learning process.

3.4.Hiding, distorting, artificially increasing or decreasing data during the evaluation process is not allowed.

3.5.The results of the student survey are not the only source for drawing a final conclusion on the performance of a professor.

4. OBJECTS AND EVIDENCE FOR ASSESSING THE QUALITY OF SCIENCE

4.1.The assessment of the quality of science is carried out based on the following interconnected chain:

National Qualifications Framework, State Educational Standards and Professional Standards, Educational Program Goals and Outcomes, Subject Outcomes, Subject Content and Teaching Methods, Assessment Tools, Student Achievements, Improvement Measures.

4.2.The following areas are studied when assessing the quality of science:

1. Compliance with scientific design and normative and methodological requirements;
2. Compliance of the results of the study with the educational program and qualification level;
3. Teaching, learning and independent learning process;
4. Quality of student knowledge assessment;

5. The results achieved by students;
6. Student opinions and educational experiences;
7. Resources and academic support;
8. Improvement work carried out in science.

4.3.The following evidence is used in the assessment:

- description of the educational program;
- National Qualifications Framework and related qualification level descriptions;
- state educational standard or state educational requirements;
- science and program outcomes correspondence matrix;
- lecture, practical and independent learning materials on science;
- main and additional literature used;
- Data from HEMIS, LMS and other information systems;
- current, intermediate and final control tasks;
- information related to academic integrity;
- the professor's analytical knowledge of the subject;
- opinions of graduates and employers, if necessary;
- previous assessment results and improvement plans.

4.4.A significant conclusion must be supported by at least two different sources of evidence.

4.5.When conflicting information is identified, no final conclusion can be drawn without further analysis or investigation.

4.6.The compliance of subject outcomes with the National Qualifications Framework can be determined not directly, but also through the outcomes of the relevant educational program.

4.7.The main evidence confirming the compliance of subject results with qualification requirements is the matrix of compliance of subject and educational program results.

5. EVALUATION PERIOD AND PLANNING

5.1.Key quality indicators for each subject are analyzed at the end of the semester in which the subject was taught.

5.2.A comprehensive assessment of the quality of science is carried out, as a rule, at least once per academic year.

5.3.The department determines the subjects to be assessed, assessment deadlines, and those responsible at the beginning of the academic year or semester.

5.4.When determining the order of assessment of subjects, the following are given priority:

- subjects with updated syllabus or content;
- subjects taught by the new professor;
- subjects in which mastery indicators have changed dramatically;
- subjects with high academic debt;
- subjects in which student applications were repeated;
- subjects in which deficiencies were identified in external evaluation;
- Subjects that form the main professional competencies for the educational program.

5.5.The subject is assessed ahead of schedule or additionally in the following cases:

1. When students' learning performance drops sharply;
2. When the percentage of students who fail the final examination increases significantly;
3. When appeals or reasoned appeals increase;
4. When a serious breach of academic integrity is detected;
5. When the content of the subject, the number of credits, or the form of teaching changes significantly;
6. When the educational program is revised;
7. When there is a risk of incompatibility between the professor's specialty and the subject;
8. When a previous improvement measure did not produce the expected result.

6. SCIENCE QUALITY ASSESSMENT PROCESS

6.1.The assessment of the quality of science is carried out in the following sequence:

planning assessment, gathering evidence, studying student opinions, analyzing scientific documents and academic results, discussing in the department, identifying improvement measures, and re-monitoring.

Planning the assessment and gathering evidence

6.2.The Education Quality Control Department, in collaboration with the Academic and Methodological Department, faculties and departments, coordinates general methodological requirements for assessing the quality of subjects.

6.3.The dean of the faculty and the head of the department ensure that the evaluation process is carried out within the established deadlines and impartially.

6.4.Evidence in the subject is provided by the professor, department, Registrar's Office, and other relevant departments within their authority.

6.5.The professor-teacher prepares a short analytical report at the end of the subject. It reflects the following:

- planned results in science;
- teaching methods used;
- factors that influenced the adoption;
- changes compared to the previous period;
- suggestions for the next period.

Studying students' opinions

6.6.An anonymous survey will be conducted among students regarding subject content, teaching methods, independent learning, curriculum, assessment, feedback, resources, and equal opportunities.

6.7.The survey is administered near the end of the semester or after the end of the subject, at a time that will not improperly influence the assessment results.

6.8.Student participation in the survey is voluntary. The respondent's identity, disclosure of their answers, or pressure on them is not allowed.

6.9.The survey questions focus on assessing the student's teaching and learning experience within the subject, rather than the personal characteristics of the professor.

OFFICIAL TRANSLATION

6.10. When studying student opinions, the questionnaire form provided in Appendix 1 to these Instructions is used. Additional questions may be included depending on the nature of the subject or educational program.

Appendix 1 to these Instructions

QUESTIONNAIRE ON THE QUALITY OF SCIENCE FOR STUDENTS

Information about the survey

This survey is anonymous. Its results will be used in aggregate form to improve the quality of science, teaching methods, and educational conditions.

Rating	Content
5	I completely agree.
4	I basically agree.
3	I partially agree.
2	I basically disagree.
1	I completely disagree.
0	I don't have enough information to rate.

T/r	Evaluation question	1	2	3	4	5	0
1	The purpose and expected results of the science were clearly explained.	☐	☐	☐	☐	☐	☐
2	Science topics were taught in a logical sequence	☐	☐	☐	☐	☐	☐
3	The science content was useful for my field of study.	☐	☐	☐	☐	☐	☐
4	The opportunity to actively participate in the training was created	☐	☐	☐	☐	☐	☐
5	The teaching methods used helped to master the topics	☐	☐	☐	☐	☐	☐
6	Independent learning tasks were aligned with subject outcomes	☐	☐	☐	☐	☐	☐
7	The total workload of the subject was consistent with the allocated credit.	☐	☐	☐	☐	☐	☐
8	Educational materials and literature were sufficient and easy to use.	☐	☐	☐	☐	☐	☐
9	Evaluation criteria explained in advance	☐	☐	☐	☐	☐	☐

OFFICIAL TRANSLATION

10	The control tasks corresponded to the results of the passed subject and subject	☐	☐	☐	☐	☐	☐
11	The assessment was carried out impartially and in an understandable manner.	☐	☐	☐	☐	☐	☐
12	I received useful feedback on assignments and results.	☐	☐	☐	☐	☐	☐
13	There was an opportunity to ask questions and receive academic help	☐	☐	☐	☐	☐	☐
14	Science has developed my knowledge and practical skills.	☐	☐	☐	☐	☐	☐
15	Science has developed my independent thinking and problem-solving skills.	☐	☐	☐	☐	☐	☐
16	An environment of respect, equality, and non-discrimination was ensured during the training sessions.	☐	☐	☐	☐	☐	☐
17	There is sufficient access to digital and other educational resources.	☐	☐	☐	☐	☐	☐
18	Overall, I was satisfied with the quality of this science.	☐	☐	☐	☐	☐	☐

1. What has been the most useful aspect of science?

.....

2. What aspects of science need to be improved?

.....

3. What topic, assignment, or teaching method would you recommend changing?

.....

4. Other suggestions and comments:

.....

Analyzing survey results

6.11. The number of students who participated in the survey and their ratio to the total number of students in the subject are recorded.

6.12.In cases where the number of respondents is insufficient to draw conclusions, survey results should be interpreted with caution in conjunction with other evidence.

6.13.According to the survey results:

- the average score for each question;
- the proportion of positive and negative responses;
- changes compared to the previous period;
- important problems and strengths are identified.

6.14.Students will be informed in a summarized form about the results of the survey and the important improvement work carried out based on them.

Analysis of academic results

6.15.The following academic indicators are analyzed by subject:

- the percentage of high, medium and low results;
- the percentage of students who failed the final examination;
- cases involving academic integrity;
- results of the previous period;
- significant differences between groups and forms of education.

6.16.The percentage of high or low grades does not automatically indicate high or low quality of the subject. The results are analyzed in conjunction with the complexity of the assessment tasks, student preparation, teaching conditions, and other factors.

6.17.When sharp differences are identified between groups or across faculty, the objective reasons for the differences are investigated.

Analysis of syllabus and subject content

6.18.The science syllabus is reviewed based on the following criteria:

1. Clarity of the purpose of science;
2. The expression of scientific results in a measurable form;
3. Compliance of subject results with the results of the educational program;
4. Linkage to the National Qualifications Framework and qualification requirements;
5. Relevance and coherence of topics;
6. The validity of the audience and independent learning load;

7. Relevance of the literature used;
8. Compliance of teaching methods with subject outcomes;
9. The evaluation criteria are stated in advance;
10. Compliance of assessment tasks with science outcomes.

6.19. There must be constructive coherence between subject outcomes, educational activities, and assessment tools.

6.20. Science materials should be scientifically accurate, up-to-date, user-friendly for students, and appropriate for the appropriate educational level.

Analysis of assessment tools

6.21. Subject-specific control tasks require students to not only repeat information, but also:

- draw a well-founded conclusion;
- It should also require the demonstration of the ability to carry out independent or creative activities.

6.22. Assessment tasks should measure relevant subject outcomes and have a level of complexity appropriate to the specified proficiency level.

6.23. Grading criteria and rubrics are announced to students prior to the assessment.

6.24. The professor provides meaningful feedback to help students understand and improve their results.

Lesson observation

6.25. If necessary, an open lesson in the subject, a peer lesson analysis, or a lesson observation with the participation of authorized specialists will be held.

6.26. The following will be studied during the lesson observation:

- clarity of the training goal;
- scientific and methodological quality of the material;
- use of student-centered methods;
- the connection between theory and practice;
- use of digital and other resources;

- ensuring an environment of equality and respect.

7. DISCUSSION OF RESULTS AND DECISION-MAKING

7.1.The evidence collected in the subject is initially analyzed with the participation of the head of the department and the relevant professor.

7.2.The professor-teacher is given the opportunity to familiarize himself with the evaluation results, provide comments, and clarify incorrect information with supporting documents.

7.3.If necessary, the head of the educational program, a specialist in the relevant field, a representative of the Educational and Methodological Department or the Education Quality Control Department will be involved in the evaluation process.

7.4.The results of the quality assessment of science are discussed at the department meeting and formalized in a report.

7.5.At the end of the discussion, one of the following decisions will be made:

1. The quality of science fully complies with the established requirements;
2. The quality of science is mostly in line with requirements, with some improvements needed;
3. There are significant gaps in science and targeted action is required;
4. A comprehensive review of the content, teaching, or assessment system is necessary.

7.6.Changes affecting the educational program, curriculum, credit hours, or other subjects will be reviewed by the relevant council and authorized departments in accordance with the established procedure.

7.7.Best practices identified in a discipline can be disseminated at the department, faculty, or University level.

8. CRITERIA FOR ASSESSING THE QUALITY OF SCIENCE

8.1.The quality of science is assessed on a 100-point scale in the following five areas:

Code	Assessment direction	Maximum score
F-1	Compliance with science design, educational program and qualification requirements	20

OFFICIAL TRANSLATION

F-2	Student-centered teaching, independent learning, and resources	20
F-3	Relevance, transparency and objectivity of the assessment	20
F-4	Analysis of student achievement and information	20
F-5	Student feedback and continuous improvement	20
	Total	100

8.2.Each criterion is evaluated at the following levels:

Execution status	Coefficient
Fully implemented and sufficient evidence is available	1.00
Basically done, there is a small flaw	0.75
Partially completed, significant improvements required	0.50
Not done or evidence not available	0

8.3.The score for each criterion is calculated based on the following formula:

Calculated score = maximum score of the criterion × performance coefficient.

8.4.The final state of science quality is interpreted as follows:

Total points	Science quality status
86–100	High quality level, best practices can be popularized
71–85	Some improvements are needed according to requirements
51–70	There are significant shortcomings, targeted action is required
0–50	A comprehensive review of the content or teaching process is necessary.

8.5.The following are considered critical inconsistencies:

- lack of an approved syllabus;
- the lack of connection between the results of science and the results of the educational program;
- the fact that the evaluation criteria were not announced to students;
- inconsistency of control tasks with the results of science;
- discrimination against students or staff;
- concealment of conflicts of interest;
- serious breach of academic integrity;

OFFICIAL TRANSLATION

- Providing unreliable or deliberately false information.

8.6. When a critical discrepancy exists, a full compliance conclusion on the quality of the science is not given, regardless of the high overall score.

8.7. A comprehensive assessment of the quality of science is carried out on the basis of the card provided in Appendix 2 to these Instructions.

Appendix 2 to these Instructions

COMPREHENSIVE SCIENCE QUALITY ASSESSMENT CARD

A. General information about science

Indicator	Information

D. Final conclusion

Total score: _____ / 100

Science quality status:

- ☐ high quality level;
- ☐ according to requirements;
- ☐ significant improvements are needed;
- ☐ A comprehensive review is needed.

Critical inconsistency:

- ☐ there is;
- ☐ not available.

Main strengths:

.....

.....

Main problems:

.....

.....

Initial recommendations for improvement:

.....

.....

9. IDENTIFY IMPROVEMENT MEASURES

9.1. When a significant deficiency, development need, or critical non-conformance is identified in science, an improvement plan is developed.

9.2. The improvement plan sets out the following:

- the root cause of the problem;
- the action to be taken;

- outcome measurement indicator;

9.3.Improvement measures may include:

1. Revise the science syllabus;
3. Update the science and program results matrix;
4. Changing the content or sequence of topics;
5. Strengthening compliance with national qualifications frameworks or occupational standards;
7. Redesigning independent learning assignments;
8. Updating assessment tasks and rubrics;
9. Updating educational materials and literature;
10. Providing methodological assistance to the professor-teacher;
11. Organizing training or experience exchange;
12. Reconsideration of subject-specialization compatibility;
13. Organizing additional academic support for students;
14. Improving material, informational or digital resources.

9.4.The implementation of the event is assessed not only by the preparation of the document, but also by the quality of the science and the practical impact it has on student outcomes.

9.5.Improvement measures in science are formalized based on the form in Appendix 3 to these Instructions.

Appendix 3 to these Instructions

Date: “ _ ” _____ 20th year

10. RE-MONITORING IMPROVEMENT RESULTS

10.1. The implementation and effectiveness of the identified improvement measures will be re-monitored in the next semester or another period specified in the plan.

10.2. The following are compared in re-monitoring:

- initial problem and current situation;
- initial and current assessment scores;
- indicators of mastery and academic debt;
- level of achievement of scientific results;
- the practical impact of the measures taken.

10.3. As a result of re-monitoring, one of the following decisions will be made:

1. The problem has been completely resolved;
2. There is a significant improvement, monitoring will continue;
3. The measure has partially yielded results, an additional task is set;
4. The measure did not produce the expected result, the cause of the problem is re-analyzed;
5. A comprehensive review of the content of the subject or the teaching system is necessary.

10.4. Recurring or systemic problems will be reported to the faculty, the Academic and Methodological Department, the relevant vice-rector, and the Education Quality Control Department.

10.5. The results of re-monitoring are documented on the basis of the card in Appendix 4 to these Instructions.

Appendix 4 to these Instructions

11. AUTHORITIES AND RESPONSIBILITIES

Education Quality Control Department

11.1. Education Quality Control Department:

- coordinates the general methodology for assessing the quality of science;
- makes suggestions for improving assessment criteria and forms;
- participates in developing the general methodology of student surveys;
- provides methodological support to faculties and departments;
- analyzes the results of generalized monitoring;
- Provides analytical information to management on systemic problems.

11.2. The Education Quality Control Department does not independently determine the final grade for a particular subject. The conclusion for the subject is formed based on evidence and departmental discussion.

Educational and Methodological Department

11.3. Educational and Methodological Department:

- coordinates the requirements for the subject syllabus and educational and methodological documents;
- participates in studying the compliance of subject results with the results of the educational program;
- provides methodological assistance in improving teaching methods and assessment tools;
- Considers changes affecting the educational program in accordance with the established procedure.

Registrar's office

11.4. The Registrar's Office, within its powers, shall:

- provides reliable information on student population and academic status.

Dean of the Faculty

11.5.Dean of the Faculty:

- supervises the organization of the science quality assessment process at the faculty level;
- summarizes the results of the departments;
- monitors the elimination of significant and recurring problems;
- Makes proposals to management regarding necessary resources.

Head of Department

11.6.Head of Department:

- develops a subject assessment plan;
 - identifies those responsible for the assessment;
 - checks the completeness and reliability of the evidence;
 - discusses the evaluation results at the department meeting;
 - ensures the development of an improvement plan;
 - monitors the implementation of the established measures;
-
- provides complete and reliable information on science;
 - ensures the quality of syllabus, teaching materials and assessment tools;
 - analyzes their own activities and student results;
 - accepts students' opinions as a source of professional development;
 - implements the identified improvement measures;
-
- to freely, voluntarily and anonymously express one's opinion on the quality of science;
 - receive information about assessment criteria and science results;
 - submit a reasoned proposal and appeal;
 - has the right to receive general information about significant changes made based on the results of the survey.

12. PRIVACY AND USE OF INFORMATION

12.1.The results of the student survey are presented in a summarized form that does not allow for personal identification.

12.2.It is not allowed to use materials from the quality assessment of science to discredit a professor, put pressure on a student, pursue personal gain, or create a conflict of interest.

12.3.Personal information is stored in accordance with applicable legislation and the University's information security requirements.

12.4.Detailed evaluation results are provided for the use of the relevant professor, department head, faculty management, and authorized structural units.

12.5.Only aggregated and non-personally identifiable information on the quality of science is provided to the public.

12.6.It is prohibited to treat a student or employee negatively for participating in a survey or other evaluation process.

13. REPORTING AND RECORD KEEPING

13.1.The department prepares a summary report at the end of the semester or academic year based on the results of the subject quality assessment.

13.2.The department report reflects the following:

- main trends in student opinion;
- the effectiveness of previous measures;
- priorities for the next period.

13.3.The faculty summarizes department reports and identifies recurring problems and best practices across the faculty.

13.4.The university-wide aggregated results are analyzed by the Education Quality Control Department based on data from the Academic and Methodological Department and other relevant departments.

13.5.Issues of systemic and institutional importance are brought to the attention of the relevant vice-rector, a meeting under the rector, or the University Council.

13.6.The reports reflect not only the activities carried out, but also the results achieved, the problems identified, the measures taken, and their practical effectiveness.

13.7.The following documents related to the assessment of the quality of science are kept in the prescribed manner:

- analytical background of the professor;
- minutes of the department meeting;

13.8. The retention period of documents is determined based on the University's document nomenclature and relevant internal procedures.

14. FINAL RULES

14.1. This Instruction establishes a single general procedure for assessing, analyzing, and determining measures to improve the quality of subjects and courses at Termez State University, as well as re-monitoring their effectiveness.

14.2. The requirements of the Instruction are mandatory for faculties, departments, professors, teaching staff, the Academic and Methodological Department, the Education Quality Control Department, the Registrar's Office, and other structural divisions participating in the process, within the scope of their powers.

- a questionnaire on the quality of science for students;
- comprehensive assessment card for the quality of science;
- improvement results re-monitoring card

It is an integral part of the instructions.

14.4. Depending on the nature of the subject, curriculum, or assessment objective, additional information or questions may be included in the forms. However, their basic content, assessment principles, and mandatory indicators should not be changed.

14.5. It is not allowed to use the results of the assessment of the quality of science to harm the honor and dignity of a professor or student, to pursue personal interests, or to apply unjustified disciplinary measures.

14.6. The persons responsible for formulating and presenting the information provided during the scientific quality assessment process are responsible for the accuracy and reliability of the information.

14.7. Issues not directly regulated by these Instructions will be resolved on the basis of applicable legislation, the National Qualifications Framework,

the University's Quality Assurance Policy and Standards, academic regulations, and other relevant internal documents.

14.8. Amendments and additions to the Guidelines will be made in accordance with the established procedure based on changes in legislation, the National Qualifications Framework, state educational standards, ESG requirements, University activities, or quality assurance needs.

14.9. Explanation of the content of the instructions and provision of methodological support for its application are carried out by the Education Quality Control Department in cooperation with the Educational and Methodological Department and other relevant structural units.

14.10. This Instruction shall enter into force after being reviewed and approved by the University Council and confirmed by the relevant order of the Rector.
